test-document

A test document for smoke testing

Heading One

This is a paragraph with some text. It should be wrapped properly using Pretext's Canvas-based typography measurement engine. The line breaks should be computed from actual font metrics, not crude character-count heuristics.

Code Example

```
function greet(name: string): string {  
  return `Hello, ${name}!`;  
}
```

A Table

Feature	Status
Markdown	Working
Code	Working
Tables	Working

This is a blockquote. It should be indented with a left border.

- Item one
- Item two
- Item three

test.ts

typescript | 25 lines

```
/**
 * Sample TypeScript file for code renderer testing.
 */

interface Config {
  fontSize: number;
  lineHeight: number;
  fontFamily: string;
}

function createConfig(overrides?: Partial<Config>): Config {
  const defaults: Config = {
    fontSize: 11,
    lineHeight: 1.5,
    fontFamily: "Inter",
  };
  return { ...defaults, ...overrides };
}

export function formatBytes(bytes: number): string {
  if (bytes < 1024) return `${bytes}B`;
  if (bytes < 1024 * 1024) return `${(bytes / 1024).toFixed(1)}KB`;
  return `${(bytes / (1024 * 1024)).toFixed(1)}MB`;
}
```

test-skill

A test skill for structured renderer testing

Test Skill

Version: 1.0 Created: 2026-04-08

I. Philosophy

Every test should be meaningful.

II. When to Use

Use this when testing structured file rendering.

III. Steps

1. Create fixture
2. Run export
3. Verify output

IV. Reflection Questions

- Does the PDF preserve section numbering?
- Are frontmatter fields rendered as metadata?
